

INTRODUCTION

Project Name: importing and securing data in service now

Project overview:

Importing and securing data in a Service Now project involves loading data from various sources into Service Now and then ensuring its security. This process typically uses import sets, transform maps, and various security measures to protect sensitive information.

Purpose

Importing and securing data in a Service Now project aims to efficiently and safely load data into the platform, ensuring data integrity and protecting sensitive information. This involves using import sets to bring data from various sources into Service Now, mapping it to target tables, and implementing security measures to control access and prevent unauthorized modifications.

IDEATIONPHASE

Problem statement:

The goal of this project is to establish a seamless connection between each record and its corresponding employee. This includes pulling specific employee attributes (such as department, role, and other pertinent details) directly into the record. By doing this, we aim to enhance reporting capabilities, improve data accuracy, reduce manual effort, and enable better visibility into record trends across the organization based on employee demographics.

Challenges:

Data Quality Issues: External data sources may contain incomplete, inconsistent, or duplicate data requiring extensive cleansing.

Complex Transformations: Mapping diverse source formats into Service Now's data structure can be technically challenging.

Security Compliance: Ensuring strict access controls and compliance with data privacy regulations can be resource-intensive.

Objective:

The primary goal of this project is to design, implement, and validate a robust process for importing data into ServiceNow from multiple external sources, while ensuring that data security, integrity, and compliance requirements are met.

REQUIREMENT ANALYSIS

Solution requirement (functional & Non functional)

Team ID	LTVIP2025TMID31005
Project Name	Importing and securing Data in service now

Functional Requirements:

following are the functional requirements of the proposed solution

FR No	Functional requirements	Sub requirement
FR-1	Tables	Create table set label to employee training records insert rows training name, completion date, status and department.
FR-2	Importing data	Open ServiceNow Search for System Import Sets Select Load Data Upload

		file (with fields: Training Name, Completion Date, Status, Employee) Set Label to Employee Training Set Name to u_employee_training.
FR-3	Using Dot walking to access employee department information	In ServiceNow, navigate to All > System Definition> List Layouts, search for Customer Orders, use dot-walking to add the Employee Department field, select it, save changes, and the field will appear in the list view.
FR-4	Access control list (ACL)	Create ACL Define ACL for Employees Set Operation to Read.
FR-5	Roles	Create role: HR Manager Add to sys_user Assign role to Tables, Application, and Module Add HR Manager role to sys_user

		Now HR Manager can view employee department info in Employee Training Records list view.
FR-6	Result	<p>Impersonate sys_user search Employee Training Records can view and edit fields.</p> <p>Impersonate another user cannot see the table.</p>

Non functional requirements:

Following are the non function requirements of the proposed solution

NFR N0	Non functional requirement	Description
NFR-1	Usability	Ensures data import and security processes in ServiceNow are clear, intuitive, and easy for authorized users to manage safely.
NFR-2	Security	Ensure secure data import by enforcing access controls, encryption, and audit logging

		to protect data integrity, confidentiality, and compliance during the import process.
NFR-3	Reliability	Ensure reliable data import by validating files, handling errors gracefully, and maintaining consistent data availability throughout the process.
NFR-4	Performance	Ensure fast, efficient data import and secure processing in ServiceNow, minimizing delays and ensuring system responsiveness during large data operations.
NFR-5	Availability	Ensures that data import and security features in ServiceNow are reliably accessible, minimizing downtime and ensuring continuous, secure operations.

Data flow diagram: A Data Flow Diagram (DFD) is a simple visual tool that shows how data moves through a system. It outlines the input, processing, storage, and output of data, helping to understand and improve system workflows.

- Where data comes from (external sources)
- Where it goes (processes and storage)
- How it's transformed along the way

Uses:

- Show how data moves through a system from input communication output
- Break down complex processes into simpler, understandable components

- Enhance communication between technical teams and business stakeholders
- Aid in system design and development by mapping data processes clearly

Technology Stack: The image shows how data flows from a third-party system into the ServiceNow app, gets processed through import mechanisms, and ends up in the Incident Table, where it can trigger further actions or updates.

Third Party → REST API → ServiceNow

- Data is sent from a third-party system via REST API.

REST API → Scheduled Import

API data is captured by a scheduled import job.

Scheduled Import → Import Sets

- Data is loaded into temporary import tables.

Import Sets → Transform Map

- Data is transformed to match the format of the target tables.

Transform Map → Incident Table

- Transformed data is saved as incidents in ServiceNow.

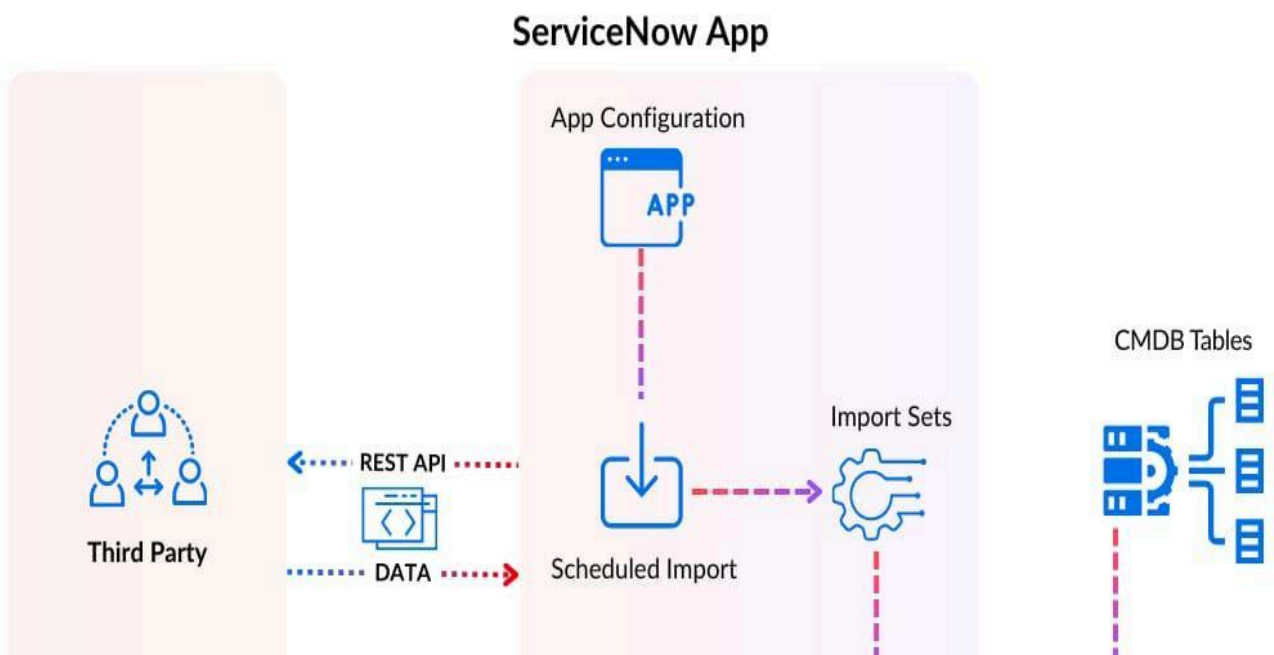

Incident Table → Triggered Actions

- Actions (like alerts, updates) are automatically triggered.

Incident Table ↔ CMDB Tables

- Incidents are linked to Configuration Items (Cis) from the CMDB.

Service now architecture

PROJECT DESIGN

Proposed solution template

Project team shall fill the following information in the proposal solution template

S No	Parameters	Description
1.	Problem statement	Linking each record to an employee and pulling some employee details (like department) into the record for easier reporting
2.	Ideal / solution description	Multi step process using important maps for data loading combined with robot security measures to protect sensitive information

3.	Novelty / uniqueness	Ensure should Data integrity and confidently during the import process and within the platform
4.	Social impact / customer satisfaction	Ensure that I is handled and securely leading to increase customer satisfaction and positive social impact
5.	Business model (revenue model)	Customer pay for the right to use service now and that includes the ability to import data from various source
6.	Scalability of the solution	Service now can handle growing that of volumes and maintain Data integrity and confidently

Milestone 1: tables

Purpose:

- Store imported data.
- Ensure data accuracy.
- Control data access.

Uses:

- Store and organize data

- Control secure access
- Link related information

Steps:

1. Open service now
2. Click on all > >search for tables
3. Select tables under system security
4. Click on new
5. Fill the following details to create a new table

ServiceNow Developers | New Record | Table | ServiceNow

dev202756.service-now.com/now/nav/ui/classic/params/target/sys_db_object.do%3Fsys_id%3D-1%26sys_is_list%3Dtrue%26sys_target%3Dsys_db_object%26sysparm_checked_items%3D%26sysp...

Guest | Finish update

servicenow | All | Favorites | History | Workspaces | Admin | Table - New Record

Table - New record

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More info](#)

* Label: Employee Training Records

* Name: u_employee_training_records

Extends table:

Application: Global

Create module: ☒

Create mobile module: ☒

Add module to menu: -- Create new --

New menu name: Employee Training Records

Remote Table: ☐

Columns | Controls | Application Access

Table Columns | for text | Search

Dictionary Entries

6. Add the following fields:
7. Training name (type: string)
8. Completion date (type: date)

9. Status (type: choice)
10. Employee(type: reference),(reference field to system user table)

ServiceNow interface showing the configuration for the 'Table - Employee Training Records'.

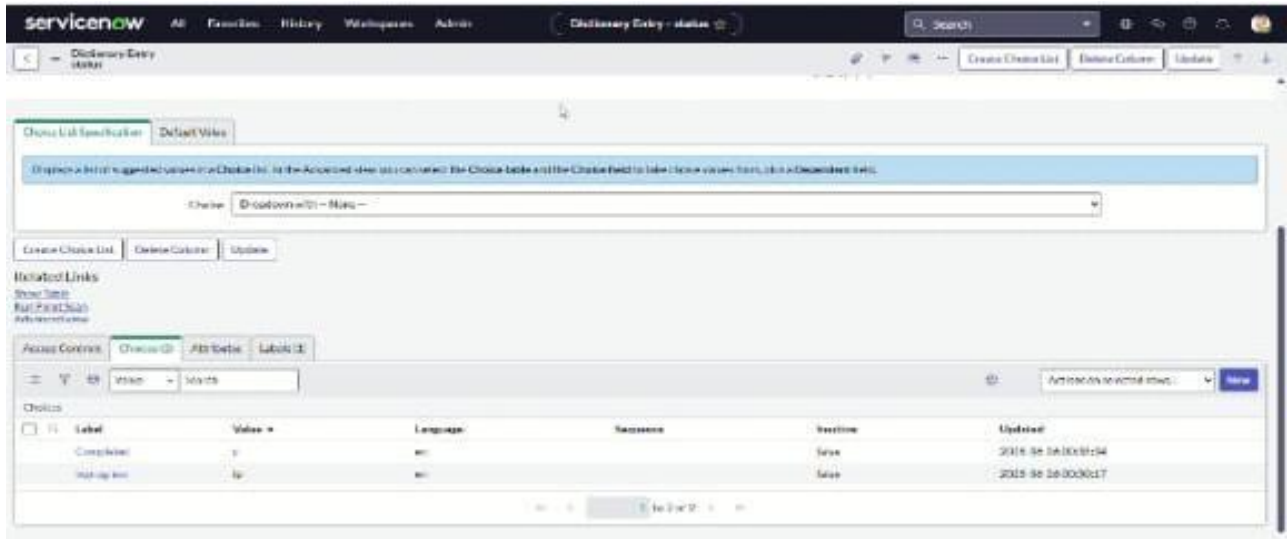

Fields:

- * Label: Employee Training Records
- * Name: u_employee_training_records
- Application: Global
- Remote Table:

Columns tab is active, showing the following columns:

Column label	Type	Reference	Max length	Default value	Display
Created	Date/Time	(empty)	40	false	false
Sys ID	Sys ID (GUID)	(empty)	32	false	false
Updated by	String	(empty)	40	false	false
Updates	Integer	(empty)	40	false	false
Updated	Date/Time	(empty)	40	false	false
Created by	String	(empty)	40	false	false
Training Name	String				false
Completion Date	Date				false
Status	Choice				false
Employee	Reference	User			false

11. Click on submit
12. Click on choice and add to choices in the dictionary entry status

Milestone 2: import data

Purpose:

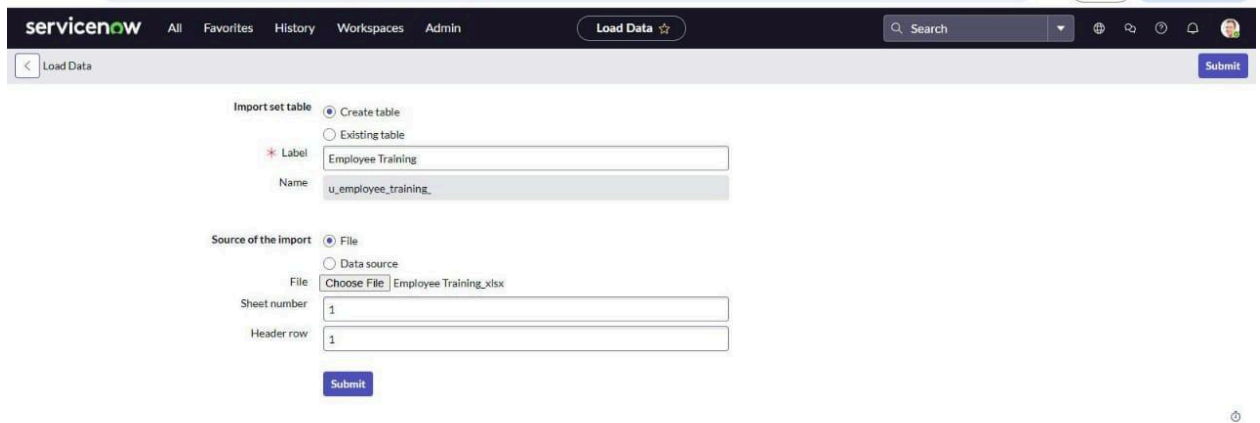

- Bring data into ServiceNow.
- Map data to correct tables.
- Enable secure access control.

Uses:

- Load external data
- Ensure data consistency
- Control secure access

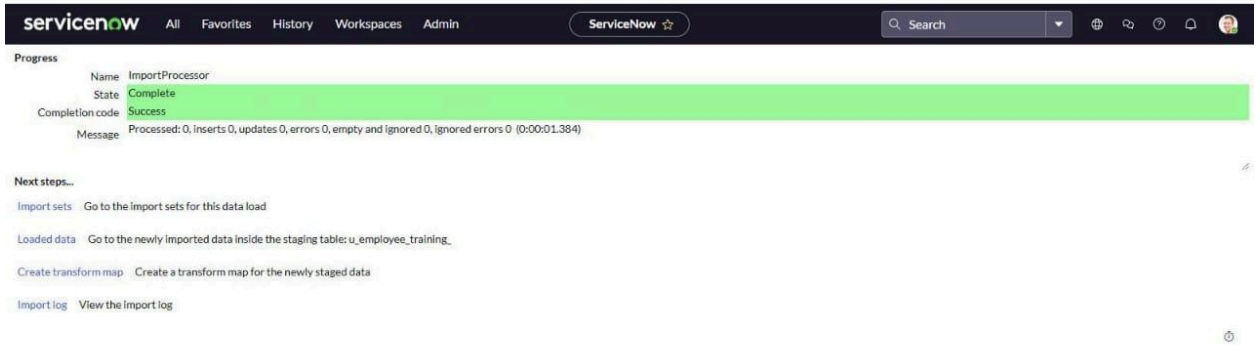

Steps

1. Open service now
2. Click on all > >search for system imports Select
3. Select load data and upload file that you have already created with four fields that are: (training name, completion date, status and employee)
4. Label: employee training
5. Name: u_employee_training

The screenshot shows the ServiceNow 'Load Data' interface. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', 'Admin', and a 'Load Data' button. A search bar is also present. Below the navigation bar, the 'Load Data' page is displayed. The 'Import set table' section has two radio buttons: 'Create table' (selected) and 'Existing table'. Below these are input fields for 'Label' (containing 'Employee Training') and 'Name' (containing 'u_employee_training_'). The 'Source of the import' section has two radio buttons: 'File' (selected) and 'Data source'. Below these are input fields for 'File' (containing 'Choose File' and 'Employee Training.xlsx'), 'Sheet number' (containing '1'), and 'Header row' (containing '1'). A 'Submit' button is located at the bottom of the form.

6. Click on submit

Map fields

Purpose:

- Match source to target fields
- Enforce data security rules
- Ensure accurate data transfer

Uses:

- Match fields
- Place data correctly
- Prevent errors

Steps:

1. Open service now
2. Click on all > > search for Transform maps
3. Fill the following details to create a new table

4. Click on submit

The screenshot shows the ServiceNow 'Table Transform Maps' configuration page for 'Employee Transform'. The 'Name' field is 'Employee Transform', 'Application' is 'Global', and 'Source table' is 'Employee Training [u_employee_training_]'. The 'Created' field is empty. Below the configuration fields, there are buttons for 'Copy', 'Update', and 'Delete'. A 'Related Links' section contains links for 'Auto Map Matching Fields', 'Mapping Assist', 'Validate Coalesce Fields', 'Transform', 'Index Coalesce Fields', and 'Run Point Scan'. The 'Field Maps (4)' tab is active, showing a table with 4 rows of field mappings. The table has columns for 'Source field', 'Target field', and 'Coalesce'. The rows are: 'u_training_name' to 'u_training_name' (false), 'u_completion_date' to 'u_completion_date' (false), 'u_status' to 'u_status' (false), and 'u_employee' to 'u_employee' (false). The table is paginated to show 1 to 4 of 4 rows.

Source field	Target field	Coalesce
u_training_name	u_training_name	false
u_completion_date	u_completion_date	false
u_status	u_status	false
u_employee	u_employee	false

5. Add field maps as shown

6. Click transform to run the import

7.

The screenshot shows the 'Progress' section of the ServiceNow interface. It displays the following information:

- Name: Transforming: ISET0010001
- State: Complete
- Completion code: Success
- Message: Transformation complete

Below the progress section, there are 'Next steps...' listed:

- ISET0010001: Go to the Import sets for this data load
- Transform history: Show the transform history, related errors and log
- Import log: View the import log

Milestone 3: using dot walking to access employee department information

Purpose:

- Retrieve related record data
- Display linked information easily
- Build reports and conditions using referenced fields

Uses:

- Retrieve related department data
- Apply security rules via ACLs
- Keep department info consistent

Steps:

1. Open service now
2. Click on all >> system definition >>list layouts
3. Search for customer orders
4. Add the employee department field by using dot walking
5. Select the field and save changes

Milestone 4: Access control list (ACL)

Purpose:

- Restricts data access
- Secures sensitive info
- Controls user permissions

Uses:

- Restrict data access
- Protect sensitive fields
- Control user permissions

Steps:

1. Open service now
2. Click on all >> ACL >> create new ACL
3. Define ACL (Employees)
4. Operation: Read

Milestone 5: Roles

Purpose:

- Assign permissions to users
- Control access to imported data
- Enforce data security policies

Uses:

- Grant specific access rights to users
- Control who can import or modify data
- Secure sensitive data during import processes

Steps:

1. Open service now
2. Click on all>>roles>>create a new role:Hr manager
3. Add in the sys_user

The screenshot shows the ServiceNow user profile page for 'User - test user1'. The page is divided into two main sections: user details on the left and integration settings on the right. The user details section includes fields for Last name (user1), Title, and Department. There are checkboxes for 'Password needs reset', 'Locked out', 'Active' (checked), 'Web service access only', and 'Internal Integration User'. The integration settings section includes dropdowns for 'Calendar integration' (Outlook), 'Time zone' (System (America/Los_Angeles)), and 'Date format' (System (yyyy-MM-dd)). There are input fields for 'Business phone' and 'Mobile phone', and a 'Photo' field with a 'Click to add...' link. At the bottom, there are buttons for 'Update', 'Set Password', and 'Delete'. Below these buttons are 'Related Links' for 'View linked accounts', 'View Subscriptions', and 'Reset a password'.

servicenow All Favorites History Workspaces Admin User - test user1 ☆ Search

[View Subscriptions](#)
[Reset a password](#)

4. Add this roll to the tables application and module

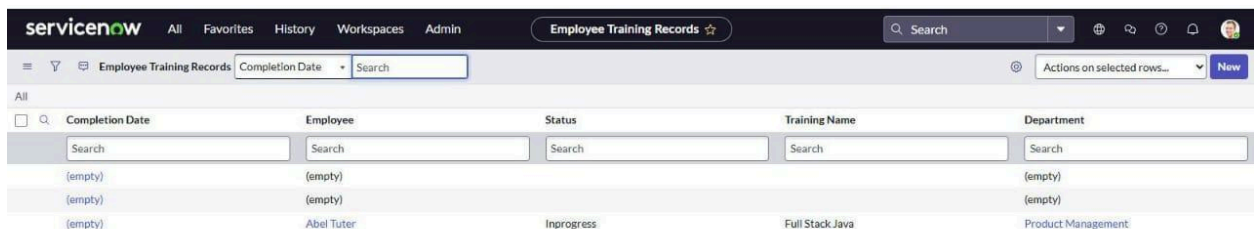

5. At the HR manager role to the sys_user

- Now you can view each employees department information directly in the employee training records list view

Update to elevate role

Completion Date	Employee	Status	Training Name	Department
(empty)	(empty)	(empty)	(empty)	(empty)
(empty)	(empty)	(empty)	(empty)	(empty)
(empty)	Abel Tuter	Inprogress	Full Stack Java	Product Management

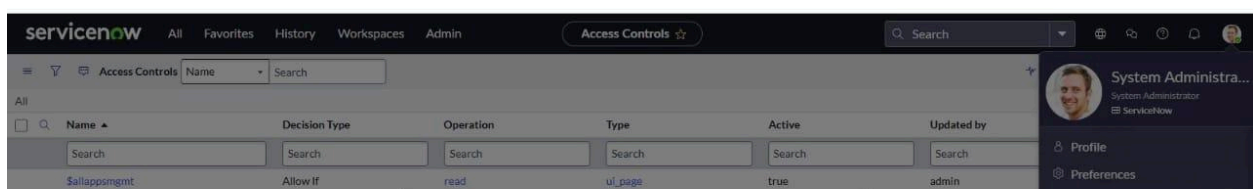

Purpose:

- Grant higher permissions for data import.
- Access restricted data and tables.
- Configure security controls during import.

Uses:

- Modify roles for data import.
- Approve imported data securely.
- Strengthen data access controls.

Steps:

Name	Decision Type	Operation	Type	Active	Updated by
(empty)	(empty)	(empty)	(empty)	(empty)	(empty)
(empty)	(empty)	(empty)	(empty)	(empty)	(empty)
Sallappongmt	Allow If	read	ul_page	true	admin

1. Create new ACL and give read access to employee training records table

The screenshot shows the ServiceNow 'Access Control' form for the resource 'u_employee_training_records'. The form is titled 'Access Control - u_employee_training_records' and includes a search bar and navigation tabs. The main configuration area includes:

- Type:** record
- Operation:** read
- Decision Type:** Allow If
- Admin overrides:** ☒
- Protection policy:** -- None --
- Name:** Employee Training Records [u_employee_training_records]
- Description:** Allow read four records in u_employee_training_records for users with role Hr Manager.
- Applies To:** No. of records matching the condition: 3
- Buttons:** Add Filter Condition, Add OR Clause
- Fields:** -- choose field --, -- oper --, -- value --

Below the main configuration area, there is a 'Conditions' section with a blue informational box:

Access Control Rules have two decision types, and these types will behave differently depending on conditions.

1. Allow Access: Allows access to a resource if all conditions are met. Additional ACLs may grant access to records where this ACL has not granted access.
2. Deny Access: Denies access to a resource unless all conditions are met. Additional ACLs may not grant access to records where this ACL has denied access.

[More Info](#)

2. Give HR manager role to the ACL

The screenshot shows the 'Conditions' section of the ServiceNow 'Access Control' form for 'u_employee_training_records'. The section includes a blue informational box with the same text as the previous screenshot.

Below the informational box, there is a 'Requires role' section with a table:

Role
Hr Manager
Insert a new row...

Below the 'Requires role' section, there is a 'Security Attribute Condition' section with a form:

Local or Existing: ☐ Existing ☒ Local

Condition: All of these conditions must be met

Field 1: -- choose field --

Field 2: -- choose field --

Field 3: -- choose field --

Buttons: OR, AND

Buttons: New Criteria

3. Create another new ACL and repeat the same process to the write access

Milestone 6: result

The screenshot shows the ServiceNow Access Control configuration page for the resource 'u_employee_training_records'. The interface includes a top navigation bar with 'servicenow' logo and tabs for 'All', 'Favorites', 'History', and 'Workspaces'. The main configuration area is divided into several sections:

- Type:** Set to 'record'.
- Operation:** Set to 'write'.
- Decision Type:** Set to 'Allow if'.
- Admin overrides:** Checked.
- Protection policy:** Set to '-- None --'.
- Name:** Set to 'Employee Training Records [u_employee_training_records]'.
- Description:** 'Allow write for records in u_employee_training_records, for users with role Hr Manager.'
- Applies To:** A section with buttons 'Add Filter Condition' and 'Add OR Clause', and a dropdown menu showing '-- choose field --'.
- Conditions:** A section with a blue box containing text: 'Access Control Rules have two decision types, and these types will behave differently depending on conditions. 1. Allow Access: Allows access to a resource if all conditions are met. Additional ACLs may grant access to records where this ACL has not granted access. 2. Deny Access: Denies access to a resource unless all conditions are met. Additional ACLs may not grant access to records where this ACL has denied access. [More Info](#)'.

Purpose:

- Confirms data imported correctly
- Identifies errors or issues
- Ensures security and compliance

Uses:

- Confirms data accuracy
- Tracks import status
- Validates security controls

Steps :

1. Impersonate the sys_user and search employee training records
2. Now you can see and edit the fields

ADVANTAGES & DISADVANTAGES

Advantages

- Ensures accurate data import and reduces errors.
- Protects sensitive data from unauthorized access.
- Helps meet regulatory requirements and industry standards.
- Maintains data consistency and completeness.
- Streamlines data import and management processes.
- Minimizes risks associated with data breaches or unauthorized access.

Disadvantages

- Importing and securing data can be a complex process, requiring specialized knowledge and expertise.
- The process can be time-consuming, especially for large datasets or complex security configuration.
- Importing and securing data may require significant resources, including personnel, infrastructure, and technology.
- Errors during the import process can lead to data inconsistencies or security vulnerabilities.
- Implementing robust security measures and importing data can incur additional costs, such as licensing fees or consulting services.

CONCLUSION:

The importing and securing Data in service now project demonstrated the essential process of importing data into Service Now using Import Sets, leveraging dot-walking to access and utilize related table data efficiently, and applying Access Control Rules (ACLs) to enforce robust data security. By combining these core functionalities, we ensured accurate data integration, streamlined data relationships, and protected sensitive information through role-based access control.
